TOXICITY OF INGESTED LIPID HYDROPEROXIDES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -!- SUBBUNIT: MONOMER.
-!- SUBCELLULAR LOCATION: MITOCHONDRIAL AND CYTOPLASMIC.
-!- ALTERNATIVE PRODUCTS: A SINGLE NUCLEAR GENE PRODUCES BOTH FORMS
-!- BY USE OF ALTERNATIVE INITIATION CODONS IN THE SAME READING FRAME.
-!- SIMILARITY: BELONGS TO THE GLUTATHIONE PEROXIDASE FAMILY.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         calpodes

                 This sequence is the murine tag7 of the invention. Cells containing the tag7 DNA sequence are used to express recombinant tag7. Tag7 is used to produce and purify antibodies; to inhibit growth of mammalian tumours, especially for treating carcinoma (of liver, ovary, breast, cervix, lung, prostate, colon/rectum, bladder, testis, stomach, pancreas, mouth, head and neck, squamous cell carcinoma or teratocarcinoma), sarroma (Raposi's, osteo- or fibro-sarcomas), melanoma or leukaemia; and as a molecular weight marker. The tag7 polypeptide inhibits tumour growth and induces apoptosis. The tag7 coding sequences are also useful as probes for gene mapping and detection of tag7 gene expression, and as primers. Antibodies against tag7 are used as reagents for detecting tag7; as an antiagonist of tag7; for isolating tag7 and therapeutically to inhibit or delay tumour

This protein comprises the precursor of a novel, claimed antimicrobial peptide from murine neutrophils, designated murine artimicrobial peptide from murine neutrophils, designated murine cognitive peptide A or MGP-A (see AAM27372). Its anno acid sequence was deduced from a cDNA clone (see AAM78510) obtained from murine bone marrow. MGP-A and the bovine homologue, BGP-A (see AAW23724), exhibit activity against Gram-positive and Gram-negative bacteria, fungi and viruses, specifically staphylococcus aureus, Escherichia coli, Candida albicans, Salmonella typhimurium and C. neoformans (claimed). They can be used in human or veterinary in properticularly to treat disorders associated with lipopolysaccharides, e.g. sepsis and endotoxaemia) or as preservatives in food products or in water supplies (claimed). They can also be applied to crops to reduce post harvest spoilage or expressed in transgenic plants to increase their disease. They have low immunogenicity. Carboxamidated analogues of MGP-A and BGP-A may also be used.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           121 NFMDRVPAKRALRAALNLLECGVSRGFLRSNYEVKGHRDVQSTLSPGDQLYQVLQSWEHY 180

Increased expression of genes encoding (I) can also be detected to diagnose tumours. Agents which inhibit the activity of (I), especially the antibodies, or an antisense oligonuclectide which hybridises to genes encoding (I), can be used to inhibit tumour growth, preferably by inducing cell death. Methods from the present invention can be used to identify compounds which inhibit the biological activity of (I). AACS8019 to AACS8102 represent PCR primers and hybridisation sequences. AACS8103 to AACS8122 and AAB24021 to AAB24040 represent human PRO polynuclactide and protein sequences given in the exemplification of the present invention for human PRO polynuclactide and protein sequences given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes an antibody that binds to a human protein (I) selected from: PRO381; PRO1269; PRO1410; PRO1755; PRO1780; PRO3434; PRO1927; PRO3567; PRO1295; PRO1293; PRO1303; PRO4344; PRO4354; PRO4397; PRO4407; PRO1555; PRO1096; PRO2038; and PRO2262.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             arthritis, dermatitis, and multiple sclerosis; inflammatory disorders e.g. inflammatory bowel disease, Crohn's disease and nephritis; hyperproliferative disorders such as paraproteinaemias and purpura; cardiovascular disorders e.g. coronary arteriosclerosis and myocarditis; cancer e.g. melanoma and lymphoma. The proteins and polynucleotide sequences may also be used in wound healing and the treatment of infectious diseases. The human secreted protein gene #8 and protein sequences are represented in sequences AAA806613 and AAB2583. Sequences AAA80662-A80663 represent genes related to the secreted protein gene#8.
          Immune disorder; Addison's disease; rheumatoid arthritis; dermatitis; multiple sclerosis; inflammatory disorder; inflammatory bowel disease; crohn's disease; nephritis; hyperproliferative disorder; cardiovascular disorder; coronary arteriosclerosis; myocarditis; cancer; melanoma; lymphoma; wound healing; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to 12 secreted human proteins and the nucleotide sequences encoding them. The polynucleotide sequences given in AABG066-880623 encode the 12 secreted protein sequences given in AABC576-B2559. The human secreted proteins have various activities dependent on the tissues in which they are expressed. Examples of the activities of the proteins include: immunosuppressant; antiparanty; antiarthritic; antirhamatic, antiproliferative, antiarthritic; antirhamatic, antiborderial; and antifungal activity. The proteins, antiviral; and antiangonists and be used to treat prevent and/or diagnose various disease, disorders and conditions examples of which include: immune disorders e.g. Addison's disease, rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               used for the prevention, amelioration and treatment of autoimmune, inflammatory, hyperproliferative and cardiovascular disorders, cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            FCNSPDSCEQQARNVQHYHKNELGWCDVAYNFLIGEDGHVYEGRGWNIKGDHTGPIWNPM 112

condition in a mammal (claimed). PGRP is useful in augmenting the immune system in such areas as immune recognition, antigen presentation and immune system activation. Antibodies or antagonists directed against these proteins may be useful in reducing or eliminating disorders associated with tumour necrosis factor (TNF) and TNF-like cytokines, such as endotoxic shock and autoimmune disorders and for treating infectious diseases including silicosis, sarcoidosis and idiopathic

The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New manmalian DNA sequences encoding transmembrane, receptor or secreted PRO polypeptides, useful for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SIGITFMGNFMDRVPAKRALRAALNLLECGVSRGFLRSNYEVKGHRDVQSTLSPGDQLYQ 172

Secreted and transmembrane proteins and nucleic acids designated PRO, useful as hybridization probes, in chromosome and gene mapping and gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy.

                                                                                                                                                                           δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This protein comprises the precursor (see AAW23722) of a novel, claimed antimicrobial peptide from bovine neutrophils, designated bovine granulocyte peptide A or BGP-A (see AAW23724). Its amino acid bovine granulocyte peptide A or BGP-A (see AAW23724). Its amino acid bovine bone marrow. BGP-A and the murine homologue, MGP-A (see AAW23725), exhibit activity against Gram-positive and Gram-negative bacteria, fungi and viruses, specifically Staphylococcus aureus, bacteria, fungi and viruses, specifically Staphylococcus aureus, bacteria, fungi and viruses, specificans, Salmonella typhimurium and C. neoformans (claimed). They can be used in human or veterinary medicine (particularly to treat disorders associated with propolysaccharides, e.g. sepsis and endotoxaemia) or as preservatives in food products or in water supplies (claimed). They can also be applied to crops to reduce post-harvest spoilage cor expressed in transgenic plants to increase their disease resistance. They have low immunogenicity. Carboxamidated analogues of BGP-A and MGP-A may also be used.
       Antimicrobial (poly)peptide(s) from bovine and murine granulocytes useful therapeutically, as preservatives for food, in water treatment and in agriculture
                                                                                                                                                                                                                                                                                                                                                        178..190

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is human full length granulocyte peptide (GP-A)

chomolog, Zgpal protein. Zgpal gene is located on human chromosome 1.

Capal polypeptides are useful for producing antibodies which are useful

for detecting cancer. Zgpal polypeptides having anti-microbial activity

are useful for treating dental carries, periodontal disease, thrush,

detecting cancer. Zgpal polypeptides having anti-microbial activity are

useful for treating dental carries, periodontal disease, thrush,

castrointestinal disease, uninary tract infections, vaginal infections,

respiratory infections, acquired immune deficiency syndrome (ALDS) and

lung infections associated with cystic fibrosis and prevention of

cinfection in skin and other epithalial wounds. Zgpal-cytokine fusion

proteins are useful for enhancing in vivo killing of target tissues

(epithelial cancers, and more specifically lung, ovarian and rectal

cancers). Zgpal polypeptides, fragments, fusion proteins or agonists are

useful in in vitro studies of exogenous microorganism infections such as

bacterial, viral or fungal infection and also to study epithelial cell

defensin induction in cell culture. Zgpal antibodies, polyuculectides and

anti-zgpal antibodies, thus serving as markers for detecting genetic

diseases or cancers. Zgpal sequences are useful as diagnostics in

canti-zgpal antibodies, thus serving as markers for detecting genetic

forensic DNA profiling and as probes or primers to clone 5' non-coding

cregions of a zgpal gene. Zgpal antibodies are useful for servening expression libraries and as

chat express zgpal, for screening expression libraries and as

changing, 2gpal protein. 2gpal gene is located on human chromosome 1.

Zgpal polypeptides are useful for producing antibodies which are useful for detecting cancer. 2gpal polypeptides having anti-inacrobial activity are useful for treating dental carries, periodontal disease, thrush, detecting cancer. 2gpal polypeptides having anti-microbial activity are useful for treating dental carries, periodontal disease, thrush, gastrointestinal disease, urinary tract infections, vaginal infections, respiratory infections, acquired immune deficiency syndrome (AIDS) and line time associated with cystic fibrosis and prevention of infection in skin and other epithelial wounds. Zgpal-cytokine fusion proteins are useful for enhancing in vivo killing of target tissues cancers, and more specifically lung, ovarian and rectal cancers, and more specifically lung, ovarian and rectal cancers, and more specifically lung, ovarian and rectal cancers, ragments, fusion proteins or agonists are useful in vitro studies of exogenous microorganism infections such as bacterial, viral or fungal infection and also to study epithelial cell defensin induction in cell culture. Zgpal antibodies, mann or americal cancers and effection and also to study epithelial cell defensin induction in cell culture. Zgpal antibodies, mann or americal cancers and anti-zgpal antibodies, thus serving as markers for detecting genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    diseases or cancers. Zapal sequences are useful as diagnostics in forensic DNA profiling and as probes or primers to clone 5' non-coding regions of a zapal gene. Zapal antibodies are useful for tagging cells that express zapal, for screening expression libraries and as neutralizing antibodies or as antagonists to block zapal activity in vitro and in vivo. Zapal gene is also useful in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               73 NELGWCDVAYNFLIGEDGHVYEGRGWNIKGDHTGPIWNPMSIGITFMGNFMDRVPAKRAL 132

> Protein Peptide

4 Gaps 16; 38.0%; Score 378; DB 21; Length 368; 40.5%; Pred. No. 1.8e-32; ive 33; Mismatches 61; Indels 1 75; Conservative Query Match Best Local Similarity Matches 75; Conserv

Novel human peptidoglycan recognition protein-like proteins (PGRP) expressed by keratinocytes (PGRP-K), wound healing tissues (PGRP-W) or chondrosarcoma tissue (PGRP-K), are disclosed. The PGRP DNA and proteins are useful for preventing, treating or ameliorating a medical condition in a mammal (claimed). PGRP is useful in augmenting the immune system in such areas as immune recognition, antigen presentation and immune system activation. Antibodies or antagonists directed against these proteins may be useful in reducing or eliminating disorders associated with tumour necrosis factor (TMF) and TNF-like cytokines, such as endotoxic shock and autoimmune disorders and for treating infectious diseases including silicosis, sarcoidosis and idiopathic Polynucleotide encoding peptidoglycan recognition protein-like protein, antibodies specific to it useful for preventing, treating conditions e.g. endotoxic shock and auto-immune disorders and infections in mammal Olsen HS; Claim 11; Fig 2A-B; 191pp; English. Rosen CA, Ruben SM, Young PE, WPI; 2000-452414/39. N-PSDB; AAA51718. pulmonary fibrosis AA; Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This is the amino acid sequence of a silkworm peptidoglycan recognition protein (PGRP). The PGRP can be used for the determination or purification of peptidoglycans, especially in for bacteria having peptidoglycans in their cell walls.
                                                                                                                                                                                                                             Silkworm peptidoglycan recognition protein; PGRP; cell\ wall; purification\ of\ peptidoglycan.

The PGRP can be used the determination or purification of peptidoglycans, especially assays for bacteria having peptidoglycans in their cell walls.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          32.7%; Score 325.5; DB 19; Length 196; 38.8%; Pred. Recombinant peptidoglycan recognition protein - and genes coding for peptidoglycan recognition proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This is the amino acid sequence for the recombinant silkworm peptidoglycan recognition protein (PGRP). The PGRP can be used for the determination or purification of peptidoglycans, especially in assays for bacteria having peptidoglycans in their cell walls.
                                                                                                                                                                                                                                                Silkworm peptidoglycan recognition protein; PGRP; cell wall; purification of peptidoglycan.
                                                                                                                                                                                             Recombinant peptidoglycan recognition protein.
